

Rust Removal from Granite & natural stone

SURFACE RUST ABSORBED INTO THE GRANITE Technical Bulletin 2

In **Technical Bulletin 1**: “Removing Surface Rust Absorbed into the Granite”, we learned **How to make a Rust Remover Poultice Patch** using our **Rust Remover Powder** and how to apply it to the stain to remove it.

Technical Bulletin 2 addresses stubborn stains and some tips on how to use our product in the most effective way. I recently was asked to consult on a very difficult job, requiring me to repeat the process 6 times. This bulletin includes my recommendations for these types of difficult jobs.

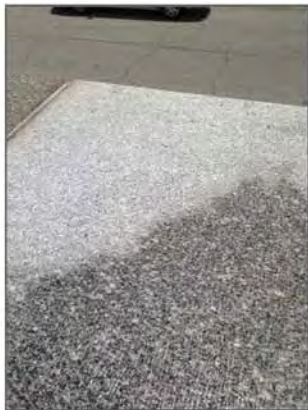

Surface Rust on Granite

1. Wet (saturate) the surface with water. Apply **Simple Stone Care's Rust Remover Powder** on the surface rust. There will be an immediate reaction as the solution reacts with the rust.

2. Use a deck brush and scrub and agitate over the rust stain well to insure the product gets into the pores of the granite to break up the rust. If rust is still on the surface, repeat the process until the rust is completely removed. Flush the area with water. Neutralize the surface with **MultiClean**.

3. Allow the stone to completely dry.

4. Once the stone is dry, apply two generous coats of **Superseal** to protect the stone. **It is important not to rush the process. Let the product work.**

Simple Stone Care

All of our products are manufactured in the U.S.A. using the highest standards of quality control.
